Fullerton - Hayward - Aiea, Hi

Faster, Faster!

M&R has announced that it will attempt to break the world record again for the most shirts printed on an automatic press in 1 hour. The attempt will take place on June 28, 2013 in London, England at the FESPA trade show.

While M&R will provide the equipment, New Buffalo Shirt Factory will provide the press operator. They set the record in 2010 with an amazing 1,909 shirts in one hour. My arms are tired just thinking about loading that many.

The event will include a New M&R Challenger III D concept press and have all the latest technology. As in the past, there is no doubt that M&R will succeed in their quest. While using state of the art technology and a passion for the screen print industry, M&R is the clear leader.

We wish them luck!

Did you know? The first Rotary multi-color garment printing machine wasn't developed until 1960!

Tech Tip: A clean shop is a happy shop. After a good equipment cleaning, apply

Silicone Spray liberally to a cleaning cloth and wipe down the press and dryer. This will make the next cleaning much easier and it give it that fresh and shiny look.

Happy "100th" Birthday

PRODUCT FEATURE

CP Tex Direct Emulsion

CP Tex is a Diazo sensitized direct emulsion that offers high water resistance for long run applications. Designed for water based, discharge and plastisol printing. It's high solids (42%) results in lower cost per screen and is extremely durable yet reclaimable. Call us today to get some. (888)435-2468

QUOTE of the MONTH

"I started with nothing and I still have most of it left".

Feel the Heat by Mike Grey

The heat is on. It's almost summer and the days are getting warmer. It's time to dust off the fans and start blowing some air around the shop. Wouldn't it be nice to be air conditioned at the press? Sounds great except for the electric bill each month. Each year at this time many shops will set up these fans to move air in the direction of the workers to cool them down. Actually this may make it warmer because the air around

the fan is already heated. It's kind of like a furnace effect. This works great in the winter months but during the summer it may be more effective to place the fans near the doorway or window and face them out to create a vacuum and pull the hot air out. This also changes out the stale air and makes it easier to breath. All this and lots of water will help make the people on the shop floor able to do their jobs more efficiently. Stay cool.....

What's happening soon?
